Szeizmikus tervezési elvek - BMEEOHSDT86 1.11 Curriculum requirements Ph.D. 1.12 Prerequisites 1.13 Effective date

2 February 2022

2. Objectives and learning outcomes

2.1 Objectives

Understanding the behavior of structures subjected to earthquakes. Importance of ductility. Modelling of steel structures. Design methods and their interpretation in the EC. Design principles. See detailed topics.

2.2 Learning outcomes

Upon successful completion of this subject, the student:

A. Knowledge

- 1. will learn the methods of earthquake resistant design
- 2. will learn the behavior of structures subjected to earthquake
- 3. will learn the typical seismic analyses
- 4. will learn the to design for ductility
- 5. will learn basic seismic design principles

B. Skills

- 1. The focus is on understanding, and on capability to apply the knowledge to new problems
- 2. see knowledge and topics,

C. Attitudes

- 1. cooperates with the lecturer and with fellow students,
- 2. is ready to apply numerical computational tools,
- 3. is intent on understanding the behavior of structures subjected to eaerthquakes,
- 4. is intent on problem solving,
- 5. is attending to the classes as a responsible member of the community.

D. Autonomy and Responsibility

- 1. is open to the new information,
- 2. is able to think in system.

2.3 Methods

Lectures and oral communications, hoping the active contribution of students

2.4 Course outline

Popper and Thomas Kuhn, measuring (scale and magnitude), seismic waves. 2. Basics of vibration: basic notions, free and forced vibration, sources and role of damping, resonance, MDOF and continuous systems, summation theorems to calculate the eigenfrequency, modal analysis. 3. cont. Design methods: basic methods in EC, support excitation by non-harmonic motion, amplification factors and response spectrum, response spectrum analysis, capacity design, performance based seismic angineering. 5. cont. Design principles: messages of EC, favorable and unfavorable structures, Hugo Bachmann's advices, numerical considerations (based on Hugo Bachmans's advices). 7. cont. Seismic resistant steel frames, development of design methodology, basic definitions and principles, structura damage definitions and parameters. 9. Dissipative structural typologies, dissipative joints and elements, behavior factor, capacity design approach. 10. Global ductility of moment resistant frames, definitions parameters affecting global ductility. 11. cont. 12. Local ductility of structural elements and joints, definitions, illustration by two-flange model, role of plastic plate buckling, methods to determine local ductility, cyclic ductility.	Hét	Előadások és gyakorlatok témaköre
2. Basics of vibration: basic notions, free and forced vibration, sources and role of damping, resonance, MDOF and continuous systems, summation theorems to calculate the eigenfrequency, modal analysis. 3. cont. 4. Design methods: basic methods in EC, support excitation by non-harmonic motion, amplification factors and response spectrum, response spectrum analysis, capacity design, performance based seismic engineering. 5. cont. Design principles: messages of EC, favorable and unfavorable structures, Hugo Bachmann's advices, numerical considerations (based on Hugo Bachmans's advices). 7. cont. 8. Seismic resistant steel frames, development of design methodology, basic definitions and principles, structura damage definitions and parameters. 9. Dissipative structural typologies, dissipative joints and elements, behavior factor, capacity design approach. 10. Global ductility of moment resistant frames, definitions parameters affecting global ductility. cont. 12. Local ductility of structural elements and joints, definitions, illustration by two-flange model, role of plastic plate buckling, methods to determine local ductility, cyclic ductility. 13. cont. Evaluation of behavior factor (q-factor) on the basis of	1.	Earthquakes: sources, plate tectonics, messages of Karl
